

Silencers Model SM3 Super Critical 30-35 dBA

Applications and Performance

Model SM3 silencers are recommended for use in areas where the surrounding noise level is relatively low. These silencers achieve a high noise reduction by utilizing a multi chamber design that incorporates a series of non-resonant tube arrangements which allow the exhaust gases to flow from one chamber to another. This creates a reversal of flow and develops a predictable amount of back pressure.

Selecting The Right Silencer

In selecting a proper size silencer for a given application, consideration must be given to the amount of back pressure that will be imposed by the silencer. Other considerations in the selection of silencers are exhaust velocity and the amount of pipe that will be used in conjunction with the exhaust system.. Custom designs are available. Optional features include mounting brackets, stainless steel and high heat black or silver paint.

All sizes and measurements are in inches (mm) and pounds (kg)

Flange connection conform to ANSI 150lbs.
Sizes 3½" and smaller have N.P.T connections
Contact SMS for "M" dimensions

The silencer may be installed at any angle. When mounting horizontally allow for a 3/8" per foot to provide drainage.

Mounting brackets, side inlet connections, clean out doors and companion flanges are available at additional cost.

The silencer is of an all welded construction and the exterior surfaces are given a coat of high temperature paint.
